

COVID-19 Antiviral Treatment

Did your patient test positive for COVID-19?

The Wisconsin Department of Health Services, in partnership with Color, is offering free consultations for providers to determine if COVID-19 treatment is appropriate.

Antiviral treatment is for people with mild to moderate COVID-19 who are **within 5 days of symptom onset**. COVID-19 treatment can help reduce the chance for severe disease and prevent hospitalization.

Here's how it works:

Step 1: If you need advice on whether COVID-19 treatment should be prescribed to your patient, call the COVID-19 treatment hotline at **833-273-6330**. Services are available 8AM - 8PM daily.

Step 2: Provide the agent with your patient's name, your facility, your preferred phone number, and the nature of your question.

Step 3: Connect with a clinician for an online consultation within 5-15 minutes.

Step 4: The clinician will provide confidential answers for questions about drug interactions or clinical challenges for your patient. Based on the clinician's answers, **you, the provider**, will ultimately decide whether or not to prescribe antivirals to your patient.
